

Tracking Inventory

Write a program that tracks your personal inventory. The program should allow you to enter an item, a serial number, and estimated value. The program should then be able to print out a tabular report in both HTML and CSV formats that looks like this:

Name	Serial Number	Value
Xbox One	AXB124AXY	\$399.00
Samsung TV	S40AZBDE4	\$599.99

Constraints

- Store the data in a persistent local data file in JSON, XML, or YAML format.
- Require numeric data for the value of each item.

Challenges

- Alter the program so that it can store photos. If you're creating this application for a mobile device, allow the user to take a picture with the camera.
- Allow the items to be searchable.
